

INVESTOR BRIEF

You're about to put a product up for sale. Is your listing good enough?

Most sellers have no idea. They write it, they publish it, and they hope.

You have a product ready to sell.

The listing is written. You're one click from going live.

But nobody tells you if it's any good.

Is the wording right? Is anything missing? There is no score, no feedback, nothing.

Your competitors sit right beside you.

Shoppers compare, then pick one. You lose the sale and never find out why.

SO BEFORE YOU LAUNCH:

Contrem Analyser

We pull up the competitors you're really up against, check your listing against them, and tell you exactly what to fix, so you go live ready to sell.

We find your competitors

The very listings a shopper is weighing yours against, not a generic industry average.

We show you what's missing

Point by point: what the winners say that you don't, and why it matters to a buyer.

We get you market ready

You get the finished wording back. Paste it in, publish, and compete on an even footing.

To make the sale you have to stand above your competitors: better content, written for your customer. **We do that for you.**

WHEREVER YOU SELL

One tool, every storefront

This is not an Amazon tool. It works on the marketplaces, on a Shopify store, and on a brand's own website, and it knows that **each one plays by different rules**. A listing that wins in one place is written differently from one that wins in another, so we judge it by the standards of the place it is actually being sold.

eBay

Titles stop at eighty characters and there are no bullet points, so the whole sale has to be made in the description.

Amazon

The richest content is pictures, not text, so an empty description is normal here, and marking it as a failing would be wrong.

Shopify and brand sites

Short product names and flowing prose, not a bullet list. Judged the marketplace way, a good brand page would look broken.

THE PROBLEM

Why guessing costs them the sale

A seller who wants this done properly hires a listing consultant. That is expensive, slow, and impossible to repeat across a whole catalogue. So most sellers reach for software instead, and the software tells them to "add more keywords," which nobody can actually act on.

Underneath both failures sits the same difficulty: **what makes a listing good is different in every category**. A supplement sells on ingredient quality and proof of testing. A skincare serum sells on what is in it, the evidence behind it, and how it feels on the skin. Software that judges both the same way is judging neither, which is exactly why generic tools give generic advice.

THE VALUE

What the seller actually gets

Expertise on demand

A specialist-grade listing review, available the moment the seller wants one, on any product in the catalogue. No booking, no brief, no waiting for a turnaround.

Their blind spots, named

The listing is measured against what the best sellers in that exact category are doing. The seller sees the specific things their competitors say that they do not.

Copy, not advice

Every recommendation arrives as finished wording the seller can paste straight into their store, plus the reason it works, backed by what the category leaders are already doing.

A choice of voice

Three complete rewrites for three different channels: one built for search ranking, one for brand storytelling, one for categories where trust is the barrier to purchase.

Category intelligence

Scoring is tuned to the category in question, so the advice is what wins in *that* market, not universal best practice that applies to nothing in particular.

Catalogue-wide reach

The same review can run across an entire product range, which turns listing quality from a project a brand occasionally commissions into something they manage continuously.

WHAT IT LOOKS LIKE

The difference it makes

A new supplement brand lists a magnesium product and writes the bare minimum, because they do not know what matters in their category.

AS THE SELLER WROTE IT

"Magnesium supplement capsules. Take daily for health support."

Says nothing a buyer can choose on. Every competitor on the page answers questions this listing does not raise.

AS CONTREM ANALYSER REWRITES IT

"Chelated magnesium glycinate: the most bioavailable form, and gentle enough on the stomach to take at full strength. Third-party tested, made in a GMP-certified facility."

Ingredient form, absorption, tolerability and proof of testing: the four things buyers in this category actually compare on.

This is the difference between a listing buyers scroll past and one they choose.

HOW IT WORKS

Three steps, and the seller does one of them

There is nothing for the seller to learn and nothing to set up. They hand us what they have already written, and we hand back what to do about it.

01	They paste it in	Their title, bullets and description, exactly as they were going to publish them
02	We do the homework	We pull up the products they are really competing with and study what is working for those sellers
03	They get it back, fixed	What is missing and why it costs them sales, plus three finished versions of their listing, ready to publish

**It takes about as long as making a cup of tea,
and it runs on every product they sell.**

WHY IT HOLDS

Why this is hard to copy

The clever technology is the easy part. Anyone can buy that. What is hard to copy is knowing what a good listing looks like in a particular market, and being able to show that our verdict is consistent and trustworthy.

Category expertise, written down

Each product category has its own standards, built by hand and weighted by what matters in that market. This is the accumulated judgement an expert consultant carries in their head, captured once and then applied to every seller in that category at no extra effort.

Judgement that is tested

The product's promise is a verdict on someone's listing, so the verdict itself is put under test: the same listing must be graded the same way twice, and strong listings must consistently outrank weak ones. That testing runs before every change ships.

It improves without rebuilding

Testing surfaced where inconsistent judgement comes from, and the fix turned out to be how the standards are worded, not how the software is built. Every category added from here is written correctly from the start, and gets sharper as the library grows.

Built to sell, not just to demo

Customer sign-ups, secure access and cost controls are already in place, so we can put this in front of paying customers rather than go back and build the business side from scratch.
